

Perform the following operation:

You are building a database for a city library to manage books and their availability.

Table: books		
Column Name	Data Type	Description
book_id	INT (Primary Key)	Unique Book ID
title	VARCHAR(150)	Title of the book
author	VARCHAR(100)	Author of the book
genre	VARCHAR(50)	Book genre (e.g., Fiction, Tech)
published_year	YEAR	Year the book was published
available_copies	INT	Number of copies currently in library

1. CREATE

- Write an SQL query to create the books table with appropriate data types and a primary key.

2. INSERT

- Insert the following 4 books into the table:

book_id	title	author	genre	published_year	available_copies
101	The Alchemist	Paulo Coelho	Fiction	1993	5
102	Clean Code	Robert C. Martin	Tech	2008	2
103	Wings of Fire	A. P. J. Abdul Kalam	Biography	1999	3
104	Introduction to Algorithms	Thomas H. Cormen	Tech	2009	4

3. READ

- Write a query to retrieve the titles and authors of all Tech books published after the year 2000.

4. UPDATE

- One copy of "Clean Code" was returned. Increase its available_copies by 1.

5. DELETE

- "The Alchemist" is no longer available. Remove it from the database.
